

RADIOLOGY REPORT

MRI Brain Without Contrast

Patient Name: Sarah Mitchell

Date of Birth: June 15, 1985

MRN: CTX-2024-001

Exam Date: February 22, 2026

Report Date: February 22, 2026

Ordering Physician: Dr. Amanda Chen, MD

CLINICAL INDICATION:

Persistent headaches, rule out intracranial pathology

TECHNIQUE:

MRI of the brain was performed without intravenous contrast.

Sequences: T1, T2, FLAIR, DWI, SWI

COMPARISON:

None available

FINDINGS:

BRAIN PARENCHYMA: Normal brain parenchyma. No evidence of acute infarction, hemorrhage, or mass lesion.

VENTRICLES: The ventricles and sulci are normal in size and configuration for patient age.

EXTRA-AXIAL SPACES: No extra-axial fluid collections.

GRAY-WHITE DIFFERENTIATION: Normal gray-white matter differentiation is preserved throughout.

MIDLINE STRUCTURES: Midline structures are normal. No shift.

POSTERIOR FOSSA: The cerebellum and brainstem appear normal. Fourth ventricle is normal.

SKULL BASE: Skull base and visualized paranasal sinuses are unremarkable. Mild mucosal thickening in bilateral maxillary sinuses, likely related to sinusitis.

IMPRESSION:

1. No acute intracranial abnormality.
2. Mild bilateral maxillary sinusitis.
3. Headaches may be related to sinus inflammation.
